

API-X Validation Workflow (Asynchronous)

Notes

1. This and other examples can be combined with others involving multiple extensions. In this case, the "Forward request to destination" step in the API-X Core element can be replaced with further extensions.
2. The option to bypass validation can be made available or not depending on institutional policies. Some simple firewall rules on the Fedora server can enforce validation globally.
3. This workflow is applicable to any other asynchronous ingest scenario.
