How to do Samvera

The group asked for some pointers about how to get going with Samvera. We agreed to set up a "contents" list and to fill it out as best we could with best practice ideas etc.

- How do I construct my Samvera objects?
- What constitutes a Samvera object?
- Compound, complex or both?
- How does Samvera handle security?
- How should I implement my security (per object or using APOs)?
- Where do I start?
  - If I'm building my own Samvera, what Samvera and Fedora components should I use at the moment?
    - Samvera and Fedora 4 - FAQ
  - What are the options for starting with someone else's Samvera application?
- What infrastructure do I need to support a production system?
