GIS Data in Fedora 4

This is a page for recording our decision making and design process around creating a shared data model for geospatial data in Fedora 4.

Questions:

- Do we continue to use XML data streams (e.g., ISO19139 or FGDC) or do we convert those to RDF? Kim has some examples of what converting to RDF might look like.
- How do we manage authority for place names?
- What tools do we need for getting GIS data into Fedora 4?
