Event-driven APIs

Fedora provides options for developing event-driven architectures around the core system.

HTTP APIs

Message Queues
Fedora can publish events on a JMS message queue.

Java APIs
Fedora provides an "EventBus" for Fedora events. Modeshape also has some tightly-integrated asynchronous operation machinery called Sequencers. ModeShape sequencers can automatically unlock the structured information buried within all of those files, and this useful content derived from your files is then stored back in the repository.
