OAI

OAI Interfaces

1. OAI-PMH Server
   1.1 OAI-PMH Server Activation
2. OAI-PMH / OAI-ORE Harvester (Client)
   2.1 Harvesting from another DSpace
   2.2 OAI-PMH / OAI-ORE Harvester Configuration

OAI-PMH Server

In the following sections and subpages, you will learn how to configure OAI-PMH server and activate additional OAI-PMH crosswalks. The user is also referred to OAI-PMH Data Provider for greater depth details of the program.

The OAI-PMH Interface may be used by other systems to harvest metadata records from your DSpace.

OAI-PMH Server Activation

To enable DSpace's OAI-PMH server, just make sure the [dspace]/webapps/oai/ web application is available from your Servlet Container (usually Tomcat).

- You can test that it is working by sending a request to: http://[full-URL-to-OAI-PMH]/request?verb=Identify
- The response should look similar to the response from the DSpace Demo Server: http://demo.dspace.org/oai/request?verb=Identify

If you’re using a recent browser, you should see a HTML page describing your repository. What you're getting from the server is in fact an XML file with a link to an XSLT stylesheet that renders this HTML in your browser (client-side). Any browser that cannot interpret XSLT will display pure XML. The default stylesheet is located in [dspace]/webapps/oai/static/style.xsl and can be changed by configuring the stylesheet attribute of the configuration element in [dspace]/config/crosswalks/oai/xoai.xml.

OAI-PMH / OAI-ORE Harvester (Client)

This section describes the parameters used in configuring the OAI-ORE / OAI-ORE harvester (for XMLUI only). This harvester can be used to harvest content (bitstreams and metadata) into DSpace from an external OAI-PMH or OAI-ORE server.

Harvesting from another DSpace

If you are harvesting content (bitstreams and metadata) from an external DSpace installation via OAI-PMH & OAI-ORE, you first should verify that the external DSpace installation allows for OAI-ORE harvesting.

First, that external DSpace must be running both the OAI-PMH interface and the XMLUI interface to support harvesting content from it via OAI-ORE.

You can verify that OAI-ORE harvesting option is enabled by following these steps:

1. First, check to see if the external DSpace reports that it will support harvesting ORE via the OAI-PMH interface. Send the following request to the DSpace’s OAI-PMH interface: http://[full-URL-to-OAI-PMH]/request?verb=ListRecords&metadataPrefix=ore
   - The response should be an XML document containing ORE, similar to the response from the DSpace Demo Server: http://demo.dspace.org/oai/request?verb=Identify
2. Next, you can verify that the XMLUI interface supports OAI-ORE (it should, as long as it's a current version of DSpace). First, find a valid Item Handle. Then, send the following request to the DSpace’s XMLUI interface: http://[full-URL-to-XMLUI]/metadata/handle/[item-handle]/ore.xml
   - The response should be an OAI-ORE (XML) document which describes that specific Item. It should look similar to the response from the DSpace Demo Server: http://demo.dspace.org/xmlui/metadata/handle/10673/3/ore.xml

For information on activating & using the OAI-PMH / OAI-ORE Harvester to harvest content into your DSpace, see Harvesting Items from XMLUI via OAI-ORE or OAI-PMH
There are many possible configuration options for the OAI harvester. Most of them are technical and therefore omitted from the dspace.cfg file itself, using hard-coded defaults instead. However, should you wish to modify those values, including them in oai.cfg will override the system defaults.

### Configuration File:
```
dspace/config/modules/oai.cfg
```

### Property: `harvester.eperson`
- **Example Value:** `harvester.eperson = admin@myu.edu`
- **Informational Note:** The EPerson under whose authorization automatic harvesting will be performed. This field does not have a default value and must be specified in order to use the harvest scheduling system. This will most likely be the DSpace admin account created during installation.

### Property: `dspace.oai.url`
- **Example Value:** `dspace.oai.url = ${dspace.baseUrl}/oai`
- **Informational Note:** The base url of the OAI-PMH disseminator webapp (i.e. do not include the /request on the end). This is necessary in order to mint URIs for ORE Resource Maps. The default value of `dspace.oai.url` will work for a typical installation, but should be changed if appropriate. Please note that `dspace.baseUrl` is defined in your dspace.cfg configuration file.

### Property: `ore.authoritative.source`
- **Example Value:** `ore.authoritative.source = oai | xmlui`
- **Informational Note:** The webapp responsible for minting the URIs for ORE Resource Maps. If using oai, the `dspace.oai.url` config value must be set.
  
  - When set to 'oai', all URIs in ORE Resource Maps will be relative to the OAI-PMH URL (configured by `dspace.oai.url` above)
  - When set to 'xmlui', all URIs in ORE Resource Maps will be relative to the DSpace Base URL (configured by `dspace.url` in the dspace.cfg file)

  The URIs generated for ORE ReMs follow the following convention for either setting: http://\[base-URL\]/metadata/handle/\[item-handle\]/ore.xml

### Property: `harvester.autoStart`
- **Example Value:** `harvester.autoStart = false`
- **Informational Note:** Determines whether the harvest scheduler process starts up automatically when the XMLUI webapp is redeployed.

### Property: `harvester.oai.metadataformats.PluginName`
- **Example Value:** `harvester.oai.metadataformats.PluginName = \n  http://www.openarchives.org/OAI/2.0/oai_dc/, Simple Dublin Core`
- **Informational Note:** This field can be repeated and serves as a link between the metadata formats supported by the local repository and those supported by the remote OAI-PMH provider. It follows the form `harvester.oai.metadataformats.PluginName = NamespaceURI,Optional Display Name`. The pluginName designates the metadata schemas that the harvester “knows” the local DSpace repository can support. Consequently, the PluginName must correspond to a previously declared ingestion crosswalk. The namespace value is used during negotiation with the remote OAI-PMH provider, matching it against a list returned by the `ListMetadataFormats` request, and resolving it to whatever metadataPrefix the remote provider has assigned to that namespace. Finally, the optional display name is the string that will be displayed to the user when setting up a collection for harvesting. If omitted, the PluginName:NamespaceURI combo will be displayed instead.

### Property: `harvester.oai.oreSerializationFormat.OREPrefix`
- **Example Value:** `harvester.oai.oreSerializationFormat.OREPrefix = \n  http://www.w3.org/2005/Atom`
- **Informational Note:** This field works in much the same way as `harvester.oai.metadataformats.PluginName`. The OREPrefix must correspond to a declared ingestion crosswalk, while the Namespace must be supported by the target OAI-PMH provider when harvesting content.

### Property: `harvester.timePadding`
<table>
<thead>
<tr>
<th>Property</th>
<th>Example Value</th>
<th>Informational Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>harvester.timePadding</td>
<td>harvester.timePadding = 120</td>
<td>Amount of time subtracted from the from argument of the PMH request to account for the time taken to negotiate a connection. Measured in seconds. Default value is 120.</td>
</tr>
<tr>
<td>harvester.harvestFrequency</td>
<td>harvester.harvestFrequency = 720</td>
<td>How frequently the harvest scheduler checks the remote provider for updates. Should always be longer than <code>timePadding</code>. Measured in minutes. Default value is 720.</td>
</tr>
<tr>
<td>harvester.minHeartbeat</td>
<td>harvester.minHeartbeat = 30</td>
<td>The heartbeat is the frequency at which the harvest scheduler queries the local database to determine if any collections are due for a harvest cycle (based on the <code>harvestFrequency</code> value). The scheduler is optimized to then sleep until the next collection is actually ready to be harvested. The <code>minHeartbeat</code> and <code>maxHeartbeat</code> are the lower and upper bounds on this timeframe. Measured in seconds. Default value is 30.</td>
</tr>
<tr>
<td>harvester.maxHeartbeat</td>
<td>harvester.maxHeartbeat = 3600</td>
<td>The heartbeat is the frequency at which the harvest scheduler queries the local database to determine if any collections are due for a harvest cycle (based on the <code>harvestFrequency</code> value). The scheduler is optimized to then sleep until the next collection is actually ready to be harvested. The <code>minHeartbeat</code> and <code>maxHeartbeat</code> are the lower and upper bounds on this timeframe. Measured in seconds. Default value is 3600 (1 hour).</td>
</tr>
<tr>
<td>harvester.maxThreads</td>
<td>harvester.maxThreads = 3</td>
<td>How many harvest process threads the scheduler can spool up at once. Default value is 3.</td>
</tr>
<tr>
<td>harvester.threadTimeout</td>
<td>harvester.threadTimeout = 24</td>
<td>How much time passes before a harvest thread is terminated. The termination process waits for the current item to complete ingest and saves progress made up to that point. Measured in hours. Default value is 24.</td>
</tr>
<tr>
<td>harvester.unknownField</td>
<td>harvester.unknownField = fail</td>
<td>add</td>
</tr>
<tr>
<td>harvester.unknownSchema</td>
<td>harvester.unknownSchema = fail</td>
<td>add</td>
</tr>
<tr>
<td>harvester.acceptedHandleServer</td>
<td>harvester.acceptedHandleServer = \ hdl.handle.net, handle.test.edu</td>
<td>A harvest process will attempt to scan the metadata of the incoming items (identifier.uri field, to be exact) to see if it looks like a handle. If so, it matches the pattern against the values of this parameter. If there is a match the new item is assigned the handle from the metadata value instead of minting a new one. Default value: <code>hdl.handle.net</code>.</td>
</tr>
<tr>
<td>Property:</td>
<td>harvester.rejectedHandlePrefix</td>
<td></td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------</td>
<td></td>
</tr>
<tr>
<td>Example Value:</td>
<td>harvester.rejectedHandlePrefix = 123456789, myeduHandle</td>
<td></td>
</tr>
<tr>
<td>Informational Note:</td>
<td>Pattern to reject as an invalid handle prefix (known test string, for example) when attempting to find the handle of harvested items. If there is a match with this config parameter, a new handle will be minted instead. Default value: 123456789.</td>
<td></td>
</tr>
