11:15 - 11:30	Wrap-up and discussion	Danny Bernstein

Resources

Summary

Description: Fedora is a flexible, extensible, open source repository platform for managing, preserving, and providing access to digital content. Fedora is used in a wide variety of institutions including libraries, museums, archives, and government organizations. The latest version of Fedora introduces native linked data capabilities and a modular architecture based on well-documented APIs and ease of integration with existing applications. Both new and existing Fedora users will be interested in learning about Fedora features. Virtual machines will be used to participate in hands-on exercises that will give attendees a chance to experience Fedora by following step-by-step instructions.

For more information, please contact [Danny Bernstein](#).
