## How to install Ruby on a Mac?

- Mac comes with Ruby
- Use RVM to get more versions of Ruby and manage versions

## How to update Ruby on Mac? (last updated 2020-06)

- In app, update file `.ruby-version` to the desired ruby version. (i.e. 2.5.8)
- `cd ..`
- `cd app_dir`
- If that version of ruby hasn't been installed yet, rvm will provide directions on how to install it.
  - For example...  
`rvm install "ruby-2.5.8"`
- Likely will need to install bundler as well. There is a way to make bundler available to all apps, but rvm did something weird.
  - `gem install bundler -v 2.1.4`
