

C Sharp Web application using Fedora APIs

Hi Everyone,

Please excuse me if this is not the correct place to post this question, It seemed like the most appropriate place. I am trying to develop a .net/c# web application to allow users to search and update fedora records and I was wondering if anyone had or knew of any sample code out there that shows to utilize the APIs in c#. I have found a few older references to this page http://www.fedora.info/resources/faq_old.shtml#csharpclient, unfortunately it is no longer available. At this point I am adding the wsdl's for api-a, api-m, and gsearch as web references however I am having trouble implementing them. Any help is greatly appreciated.

Thanks

Joe
