

How to Purge an Object

To purge an object is to completely remove it and its record from the repository. Usually, in Islandora, this is referred to as 'deletion' rather than 'purging'. This tutorial will walk you through the steps to purging a single object.

 This action cannot be undone. You will be reminded of this before Islandora follows through with the purge request.

- 1. Navigate to the page of the object you would like to delete and click the 'Manage' tab.**

Object we need to get rid of

[View](#)[Manage](#)[Item Policy](#)

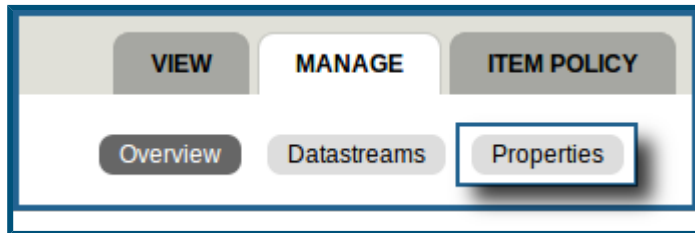

In collections

- [Object Collection](#)

[Details](#)

You can do this by searching for the object, or navigating to its collection and page through the repository itself. In this example, we will be removing an object with the 'Basic Image' content model.

2. Click the 'Properties' button

This will take you to that object's properties management page.

3. Click the 'Delete' button

A screenshot of a web form titled 'Item Label'. The form has three main sections: 'Item Label' with a red asterisk and a text input field containing 'Object we need to get rid of'; 'Owner' with a red asterisk and a text input field containing 'admin'; and 'State' with a red asterisk and a dropdown menu set to 'Active'. Below the form, there are two buttons: 'Update Properties' and 'Delete'. The 'Delete' button is highlighted with a blue rectangular border.

This will take you to the delete confirmation screen.

4. Confirm the deletion by clicking 'Delete' again
