

Harvester

Overview

The Harvester module allows you to import metadata from OAI-DC URLs and spreadsheets in CSV and TSV format (as long as the column headers correspond to DC metadata fields). Objects will be created with both DC and MODS Datastreams - the MODS metadata simply gets crosswalked from the DC metadata. No binary files (images, audio, PDFs, etc.) will be imported during this process, but these files can be added to the objects after import (if desired).
