Packages

This category includes standalone packages that are installed on the server itself as opposed to your Islandora installation. This means that you will likely need administrator access to the server before installing these components. Because of the nature of installing software, and the differences between operating systems, it is unlikely that we will be able to give more than basic support instructions for these dependencies. Please check each dependency's website for details on how add them to your server.

- ffmpeg and ffmpeg2Theora
- Ghostscript
- LAME Encoder
- pdftotext
- Tesseract
