

Islandora JWPlayer

Overview

JWPlayer is an in-browser multimedia player made by Longtail Video. Islandora uses it to create players for objects using the [Audio Solution Pack](#) and [Video Solution Pack](#), so that they can be streamed directly inside a user's browser instead of requiring them to download it to their own computers first.

Dependencies

- [Islandora](#)
- [Tuque](#)
- [Libraries API](#)
- [JW Player](#) (ver. 6.12)

Provisions

- [Audio Solution Pack](#)
- [Video Solution Pack](#)

Downloads

The JWPlayer library is free for non-commercial use, but only version 6.12 of that library is compatible with the Islandora JWPlayer module. Unfortunately, the website [jwplayer.com](#) no longer allows new users to register as legal users of version 6.12. The only free version they offer now is version 7.x. This is not a problem for current users of JWPlayer version 6.12. They should feel free to continue using it. Otherwise, for new implementations of video on Islandora we highly recommend using the video.js library instead. You can get information on the [Islandora Video.js](#) module from the [Release Notes and Downloads](#) page.

Configuration

Check the [Audio Solution Pack](#) and [Video Solution Pack](#) pages' configuration sections for more information on how set JWPlayer as a viewer.

This  module has been updated to use jwplayer6.
