

# SI - Return a representation that is stable regardless of changes in the underlying object or objects

Title (Goal)	As a data user, I want a representation returned that is stable regardless of changes in the underlying object or objects
Primary Actor	Data user
Scope	
Level	
Author	<a href="#">Daniel Davis</a>
Story (A paragraph or two describing what happens)	Often the implementation of the system or data changes, I should be able to ask the repository for a representation that is always the same.

As a data user, I want to want to get a representation from the repository that is always the same. As a data user I am comfortable using URIs to access data but often I expect that when I ask for a representation for a resource, I always get the same result. Without this feature, should the underlying data be restructured I may get a different representation, therefore I cannot trust what is returned the next time I ask for the resource.

- I want exactly same image every time I access the same URI
