

# DuraCloud Java Client

## StoreClient

DuraCloud provides access to files stored in cloud storage systems through an application called DuraStore. DuraStore is installed and running on your DuraCloud instance and can be accessed via a [REST](#) interface. In order to aid Java developers in communicating with DuraStore, a Java client, called StoreClient was written.

## Using the client

To use the StoreClient, you will need to include the necessary dependencies. This is best done using Maven, as follows:

### StoreClient

```
<dependency>
  <groupId>org.duracloud</groupId>
  <artifactId>storeclient</artifactId>
  <version>{duracloud-version}</version>
</dependency>
```

## Example code

### StoreClient

An example Maven-based project which provides examples for using the storeclient can be found on Github here: <https://github.com/duracloud/rest-client-example>
